full moon

Meteoroids

are in
space.

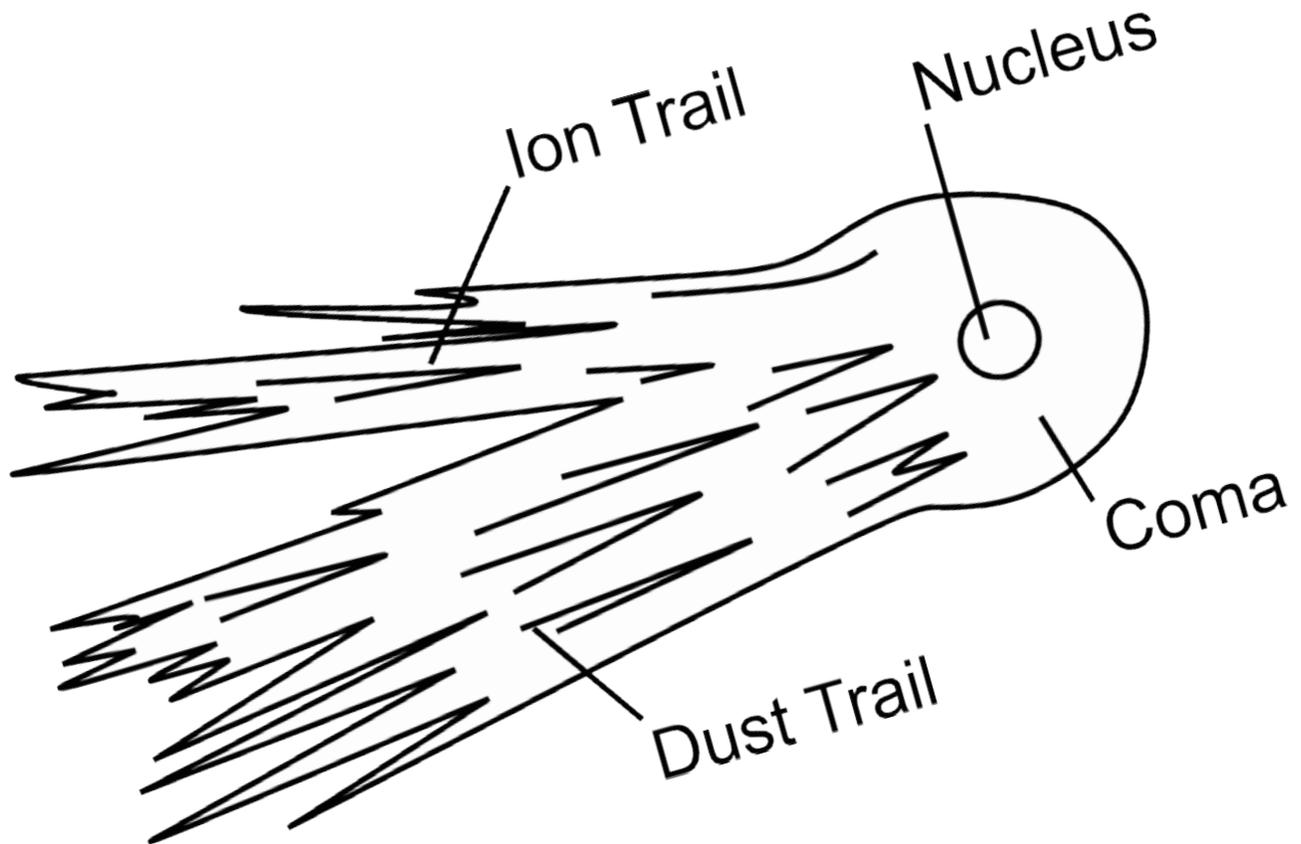

Meteors are in
the earth's
atmosphere.

Meteorites have landed on
the surface of the earth.

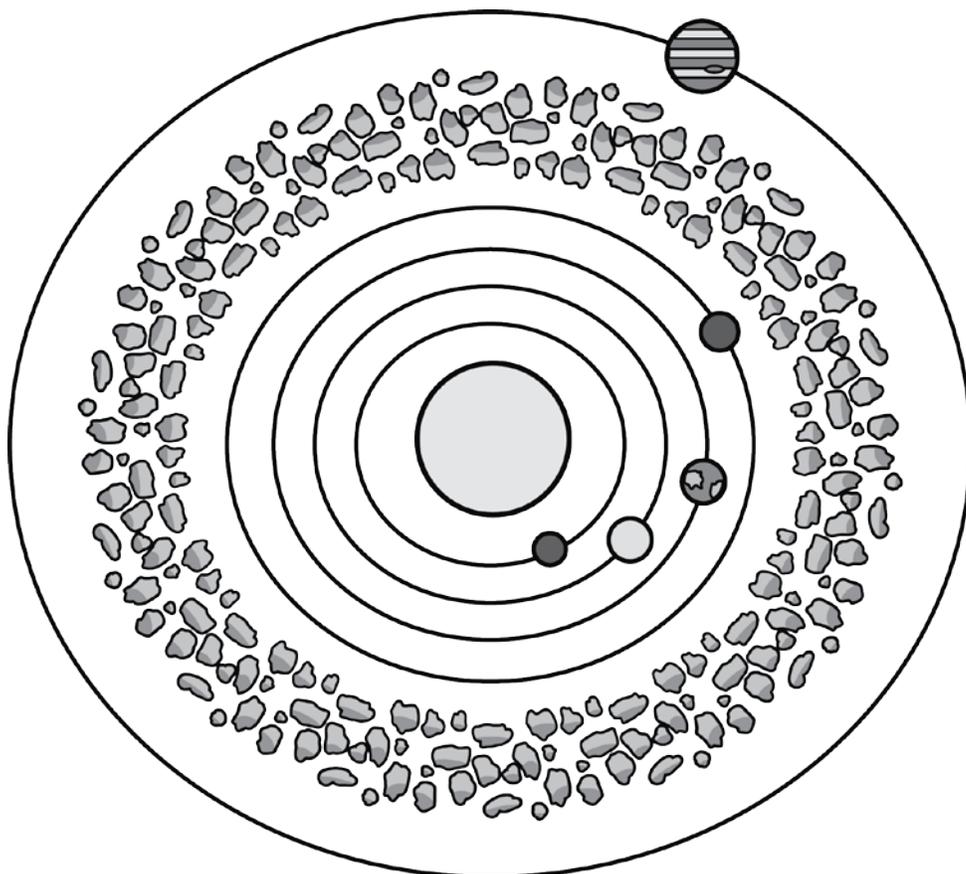

Comets orbit the sun.

A comet is made of ice and dust. When it nears the sun, the heat creates a tail of gas and dust particles.

Asteroids are minor planets.

They are rocky, metallic, and icy bodies. They are the leftovers from planet formation.

Most are found in the asteroid belt. This is between Mars and Jupiter.

Before you can make a
dream come true,
you must first have one.

- Ronald McNair
